Notice

Every Group has access to:

1 x watsonx assistant **Plus Plan**

1x watsonx assistant **Trial Plan**

You should use the Trial Plan for completing this lab as well as to play around, test things and to understand how watsonx assistant works while you must use the Plus Plan for implementing your final solution for your specific use-case. In case of any questions do hesitate to contact us directly or via slack.

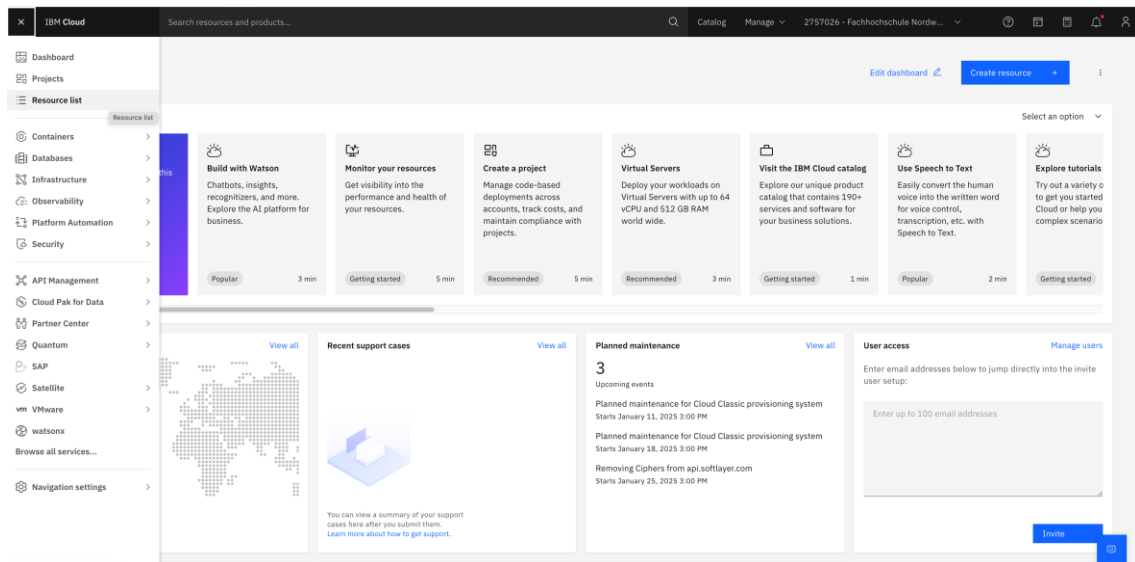

Note: Every Group Member can create its own assistant in the Trial Plan but not in the Plus Plan. In the Plus Plan, every group has exactly one assistant.

Important!

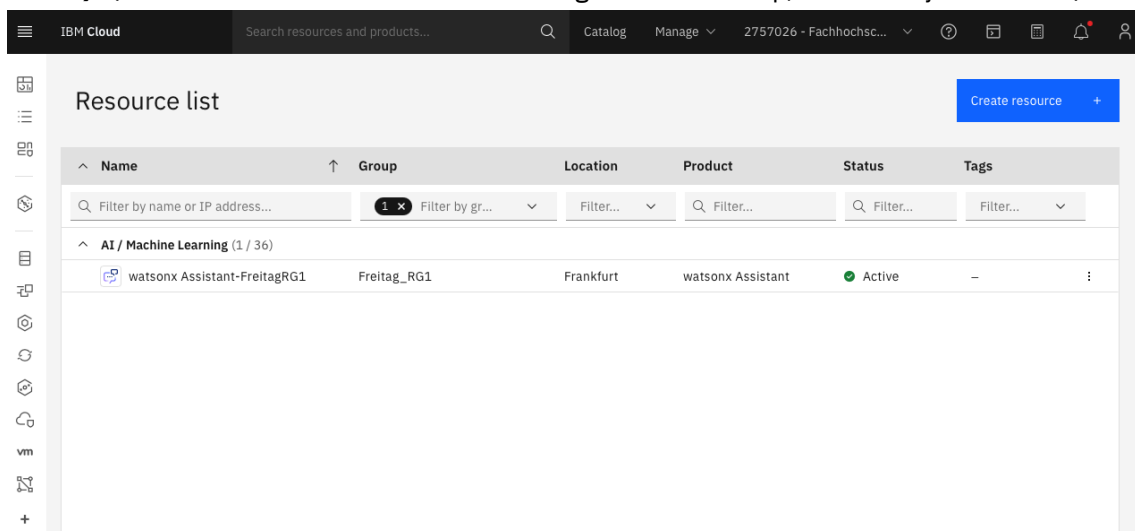

You may **skip the first task**, as the watsonx assistant instance has already been set up. Each group has access to one watsonx assistant, which can be found in your resource list under AI / Machine Learning. **Your assigned watsonx assistant corresponds to your group number.** Therefore, you can proceed directly to [Task 2](#). Enjoy!

Task 1: Select the watsonx Assistant Trial Instance in the IBM Cloud

1. In a web browser, navigate to the following URL <https://cloud.ibm.com/>
2. Log in with your IBM Cloud credentials. This should be **your IBMid**.
3. You should view the dashboard which shows a list of your applications and services.
4. Open the hamburger menu located in the top left corner and select “Resource List”

5. You should now see both **project specific watsonx assistant instances (Plus & Trial Plans)**. (Note: The Plus Plan is under the Freitag Resource Group, don't worry about that.)

6. Click on the watsonx assistant instance with the **TRIAL** suffix.

7. In the *Credentials* section click **Show Credentials**. You should see the *API Key* for your service. Feel free to copy them to your clipboard, to a text file, or just return to this section of the IBM Cloud web interface when the credentials are needed.

Credentials

Download  Show credentials 

API key:
..... 

URL:
https://api.us-south.assistant.watson.cloud.ibm.com/instances/7860aa41-2d96-44b7-bab5-2e... 

8. **Launch the watsonX** assistant by clicking the **Launch Watson Assistant** Button.

9. Create a new assistant → select **Create New +**

IBM watsonx Assistant Lite Start Trial Test ^

View all assistants  Create New +

Assistant Builder Home

10. **Enter a name** for your assistant, a **description** and choose its **language**.

(Each Group Member can create their own assistant in the TRIAL Plan but not in the PLUS Plan.)

Create a new assistant ×

Assistant name
My First Bot

Your assistant name will be kept internally and not visible to your customers

Description (optional) 27/128
Description of My First Bot

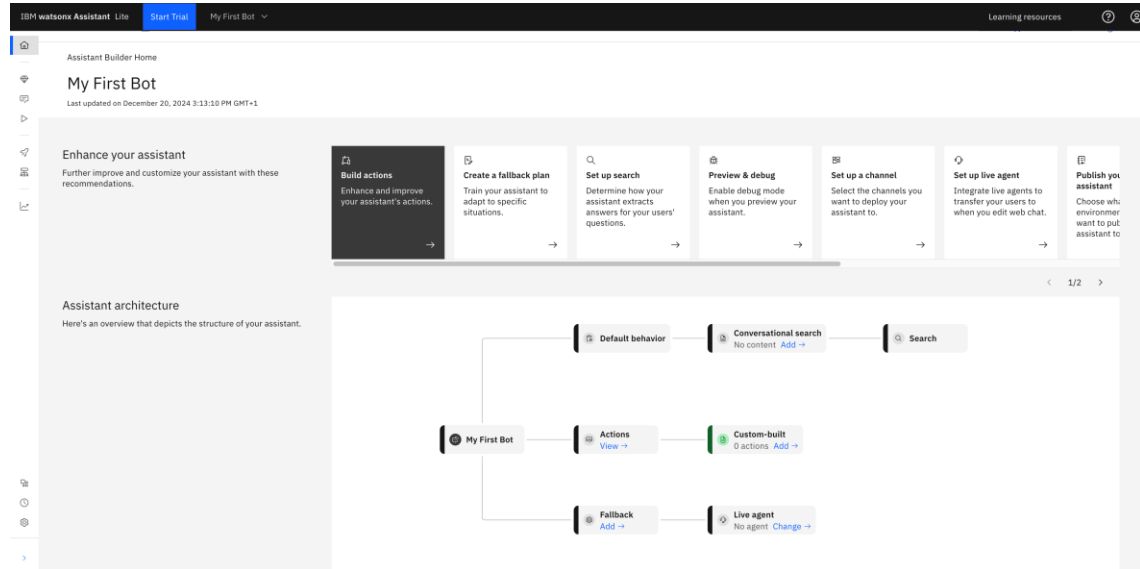

Assistant language
English (US) ▾

This is the language your assistant will speak.

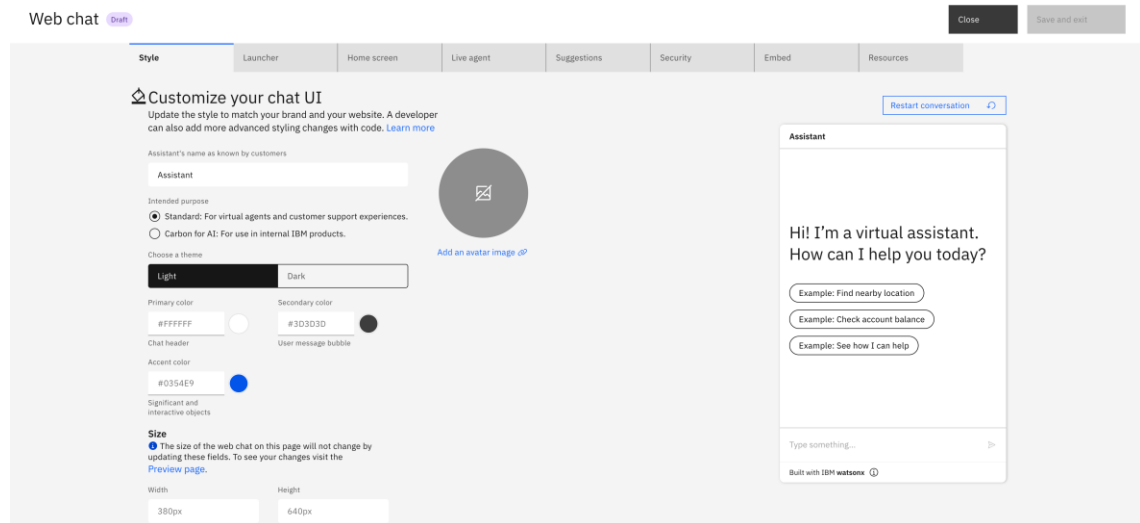

Cancel Create assistant

11. Congratulations you have created your first watsonx Assistant!

You will be greeted with the following menu:

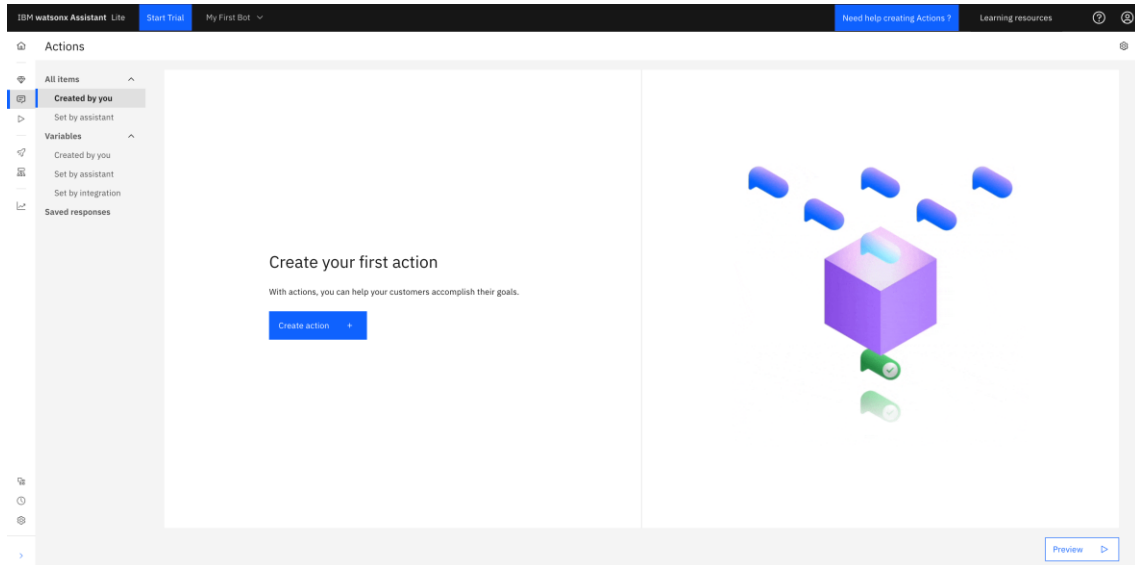

12. Now you can see its **architecture** and **enhance** your assistant (e.g., you can select **Customize web chat** and design your chat UI and see a preview of your assistant):

Task 2: Create an Action from Template

1. In the **Assistant Builder Home** view (see Task 1, Step 11) select **Actions**.
2. Create a new **Action** by clicking the **Create action** button.

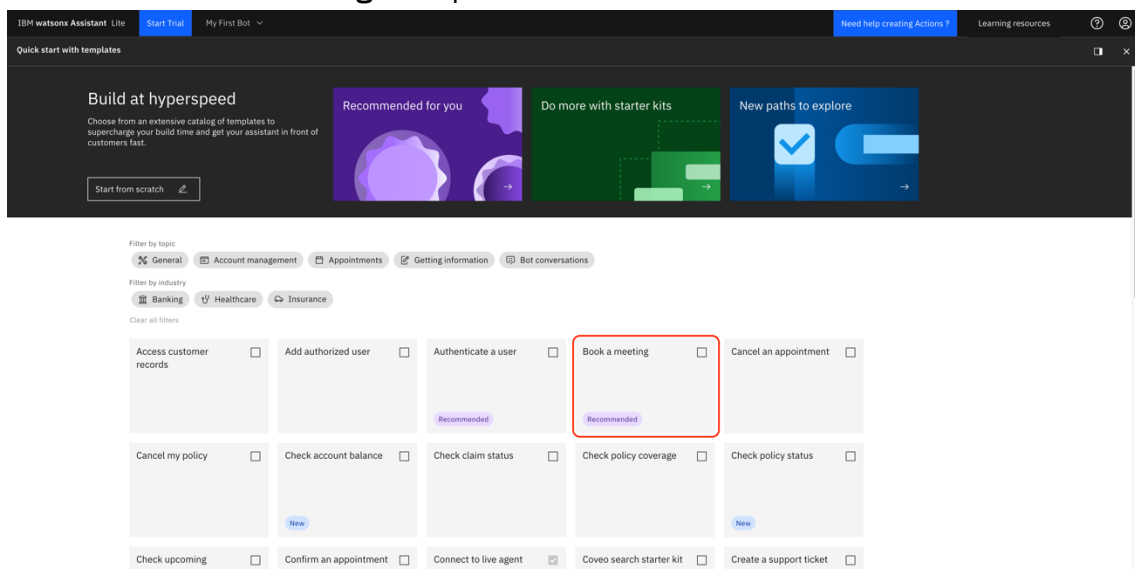

3. Actions can be created from scratch or from templates. Choose **Quick start with templates**.

How would you like to build your action?

4. Select the **“Book a Meeting”** Template

5. A sidebar will open with all the selected templates. Click **Add templates**.

6. **Congratulations!** You have added a new *Action from Template*. Select your newly created template **Book a meeting** under **Created by you** to customize it further. You can also interact with your assistant by clicking on **Preview**:

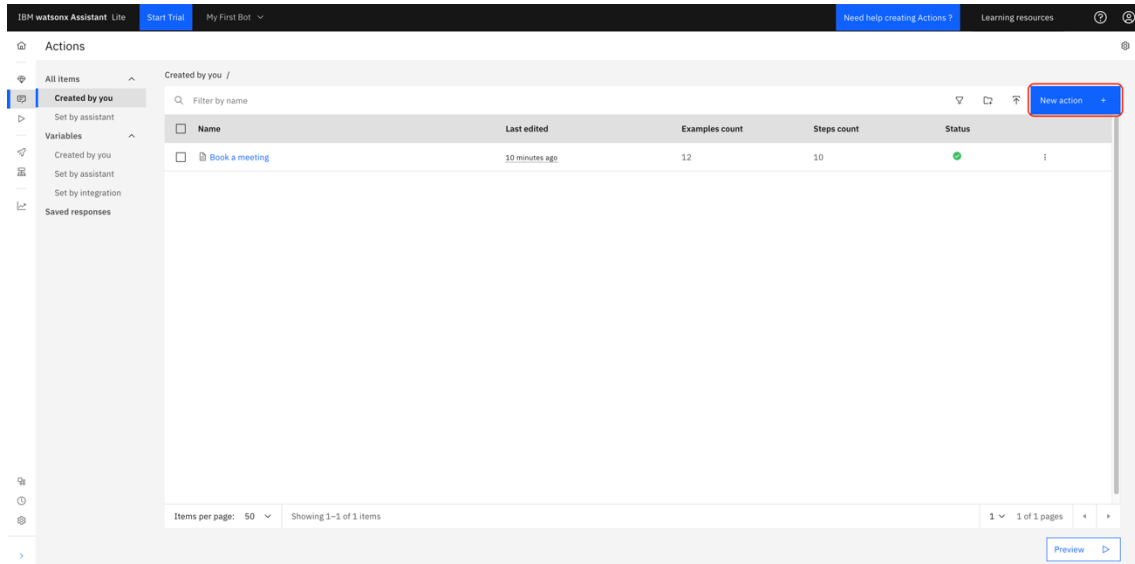

The screenshot shows the IBM Watsonx Assistant interface. The top navigation bar includes 'IBM watsonx Assistant - Life', 'Start Trial', 'My First Bot', 'Need help creating Actions?', and 'Learning resources'. The main section is titled 'Actions' and shows a list of actions under the 'Created by you' filter. A table lists the actions, with the first row highlighted in red:

Name	Last edited	Examples count	Steps count	Status
<input type="checkbox"/> Book a meeting	6 minutes ago	12	10	●

At the bottom right of the interface, there is a 'Preview' button with a right-pointing arrow, also highlighted with a red box.

Task 3: Chitchat Action (Request/Response)

1. Create a new **action** by clicking the **New action +** button on the top right.

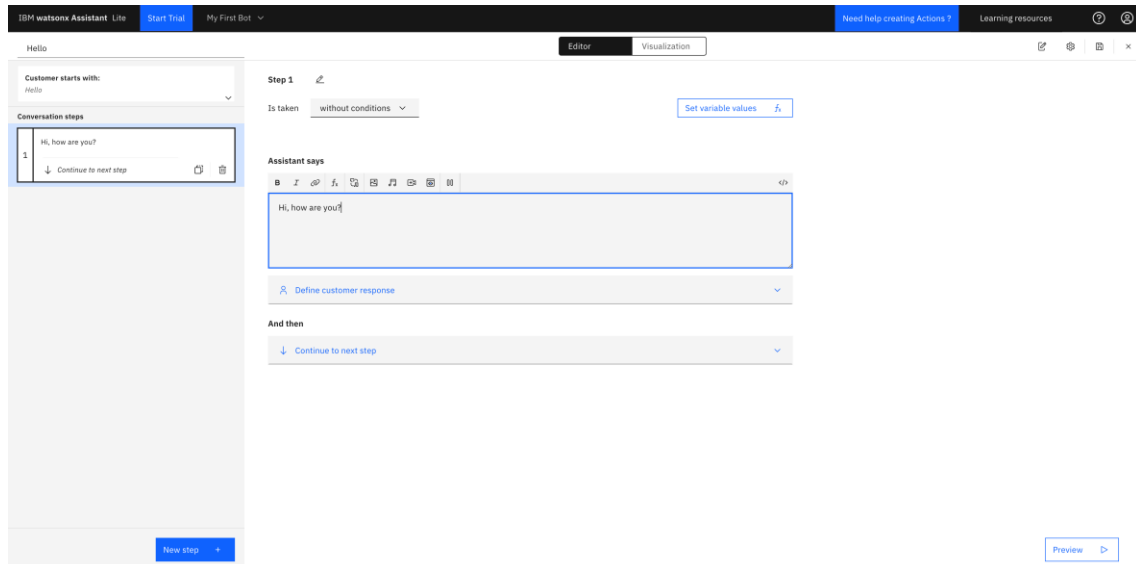

2. Actions can be created from scratch or from templates. Choose **Start from scratch**. How would you like to build your action?

3. Enter in the textfield: Hello. This is what your customer would say to initiate a conversation. Click on **save**.

The screenshot shows the 'New action' dialog box. The input field contains the text 'Hello'. Below the input field are two buttons: 'Cancel' and 'Save'. The 'Save' button is highlighted in blue.

- This time we will define a static response returned by the assistant. Enter in the **Assistant says** textfield: *Hi, how are you?*

- You can add additional steps (**New step +**) and define a more sophisticated flow of the conversation. Under **Define customer response** you can pre-define response options for the customer.
- Congratulations!** You have defined your first **Action from scratch**. Your assistant updates automatically, to see your new action select the **Preview** button in the bottom right corner.

Task 4: Information Extraction & Session Variables

In this Task we will extract information provided by the user via chat and store it in a context variable. Learn more on: <https://cloud.ibm.com/docs/watson-assistant?topic=watson-assistant-manage-info#store-session-variable>

1. Create a new **action** (see Step 1, Task 3).
2. Choose **Start from scratch**:
How would you like to build your action?

 Start from scratch Build with actions using your own use case.	 Quick start with templates Use one of our pre-built templates and use cases.
---	---

3. **Define** an example Phrase (e.g., Hi) that will start the conversation:
(Note: it should be a different one from before to not trigger the same action)

New action ×

What does your customer say to start this interaction?

Cancel Save

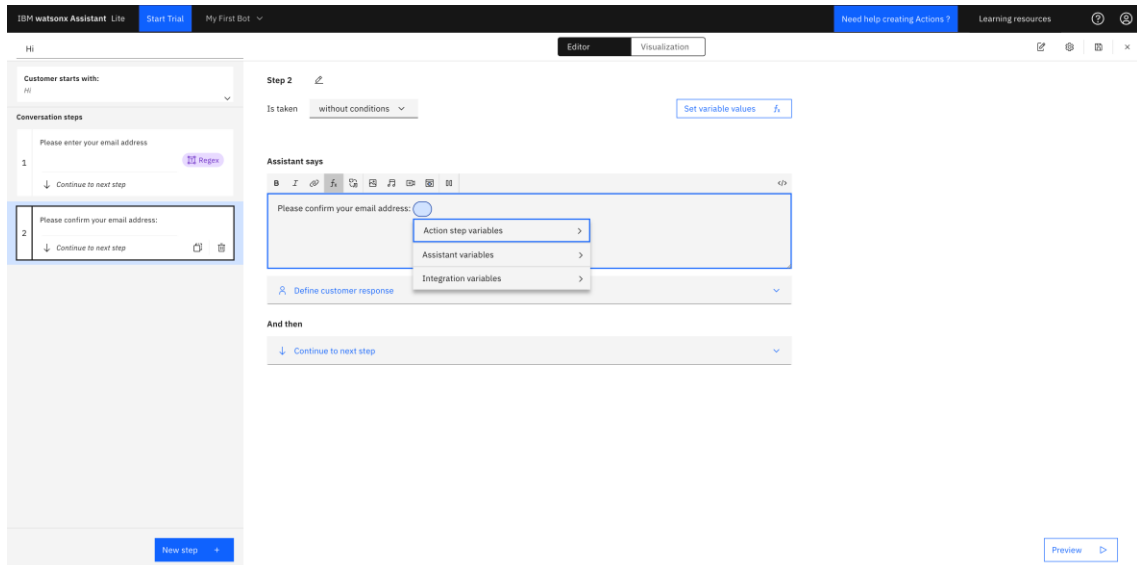

4. **Define** what the assistant says (e.g., *Please enter your email address*). Then select **Define customer response** and select **Regex** and select the **Email Regex** in the Dialog.

The screenshot shows the IBM Watson Assistant interface. On the left, a conversation step is defined with the prompt "Please enter your email address:". On the right, the "Define customer response" dialog is open. The "System" tab is selected, and the "Regex" option is chosen from the list. The "Regular expression" field contains the email regex pattern: `Email: \b(?:[A-Za-z0-9!#$%&*+=/?^_`{|}~]+(?:\.[A-Za-z0-9!#$%&*+=/?^_`{|}~]+)*)"@(?:[x01-x08\x0b\x0c\x0e-\x1f\x21]...`. The "Assistant says" field contains the text "Please enter your email address:". The "Preview" button is visible at the bottom right.

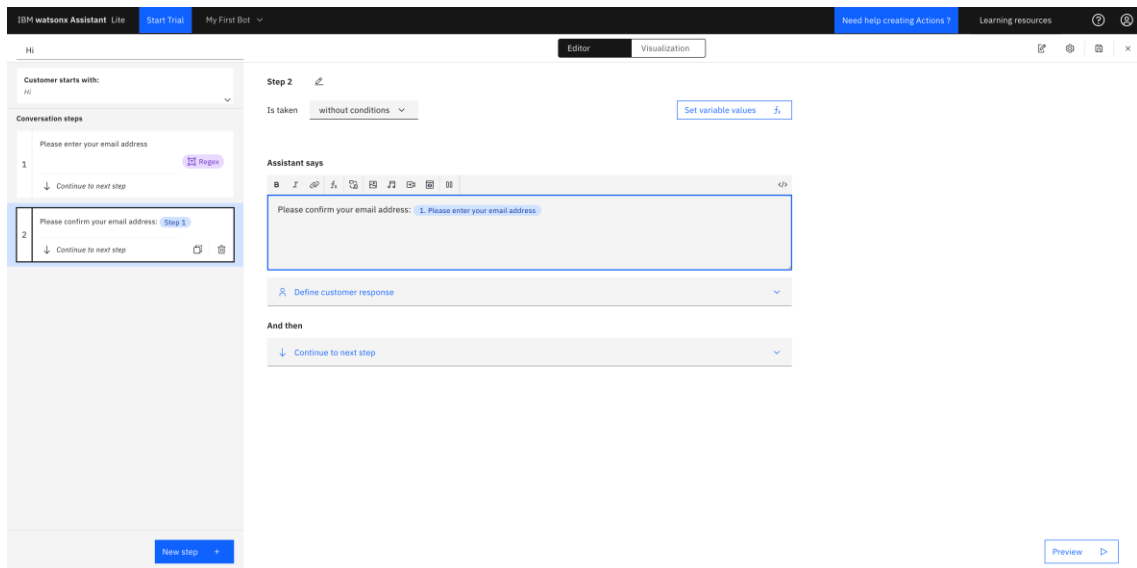

Select **Email** as the type of regular expression and click **apply**:

The screenshot shows the "Edit response" dialog. The "Type" is set to "Regular expressions". The "Regular expression" field contains the email regex pattern: `Email: \b(?:[A-Za-z0-9!#$%&*+=/?^_`{|}~]+(?:\.[A-Za-z0-9!#$%&*+=/?^_`{|}~]+)*)"@(?:[x01-x08\x0b\x0c\x0e-\x1f\x21]...`. The "Test" section shows a text input field with the placeholder "Test out your regular expression here". Below the test field, a note states: "This test uses a browser-based regex engine that may not match the Google RE2 engine used by watsonx Assistant. Also use Preview to test any step that uses a regex response type." The "Assistant recognizes:" section is empty. At the bottom, there are "Cancel" and "Apply" buttons.

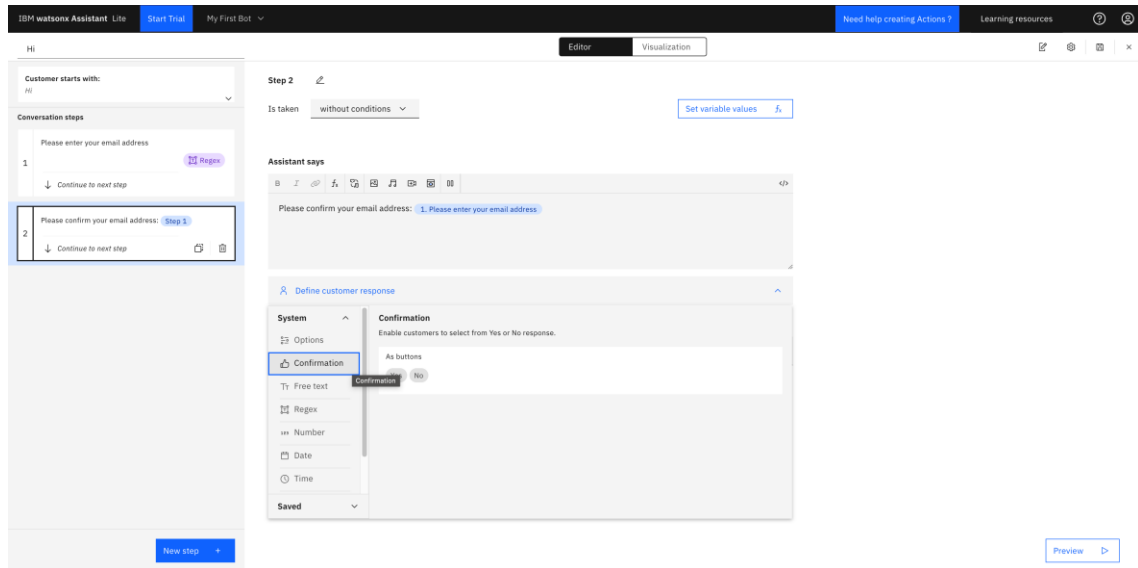

5. Create a new step by clicking the **New Step +** button in the bottom left corner. **Define** what the assistant says to confirm the email (e.g., *Please confirm your email address:*) and enter a “\$” sign to open the variables context menu.

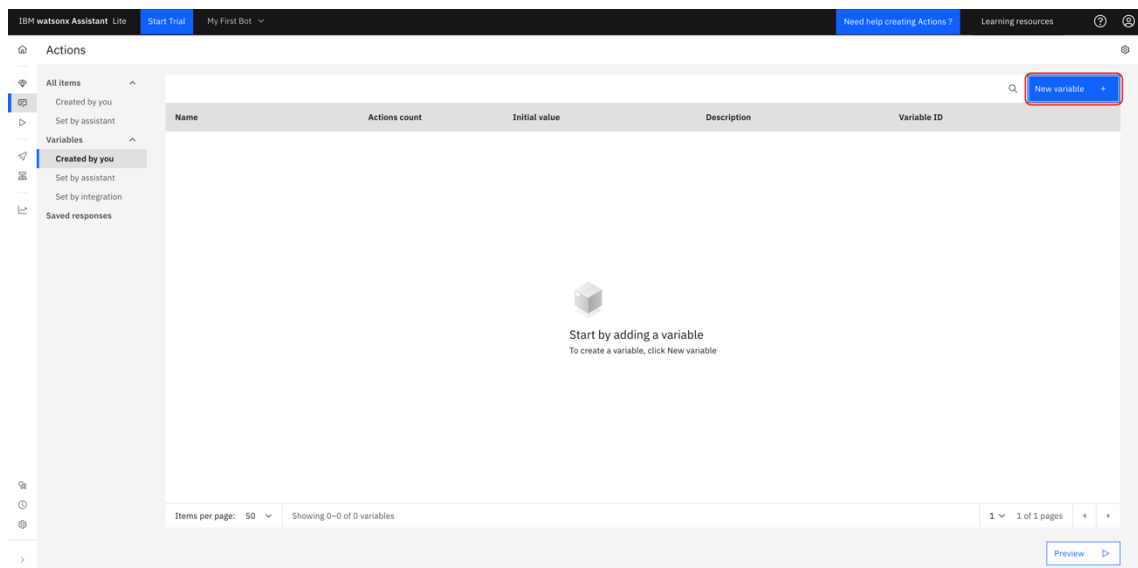

Select the **Action Step Variable** “1. Please enter your email address” from the previous conversation step. Through this configuration the assistant is now able to access the email address provided by the user in the previous step and display it in its response.

6. **Define** a customer response of type **Confirmation** to present yes and no buttons to the user.

7. **To create a new Session Variable** navigate to Actions → Variables → Created by you and click on **New Variable +**.

Fill in the following values and save the variable:

Session variable

Name

Email

Variable ID

Email

Type

Tr Free text

Initial value (optional)

☐ Use expression

Description (optional)

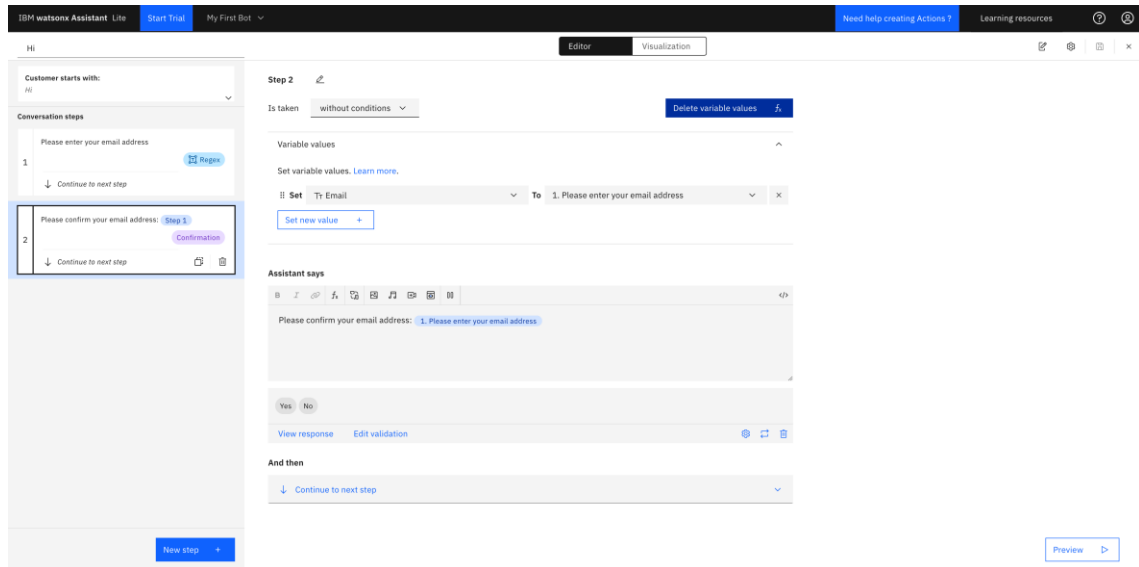

Privacy

☒ Protect data stored in this variable

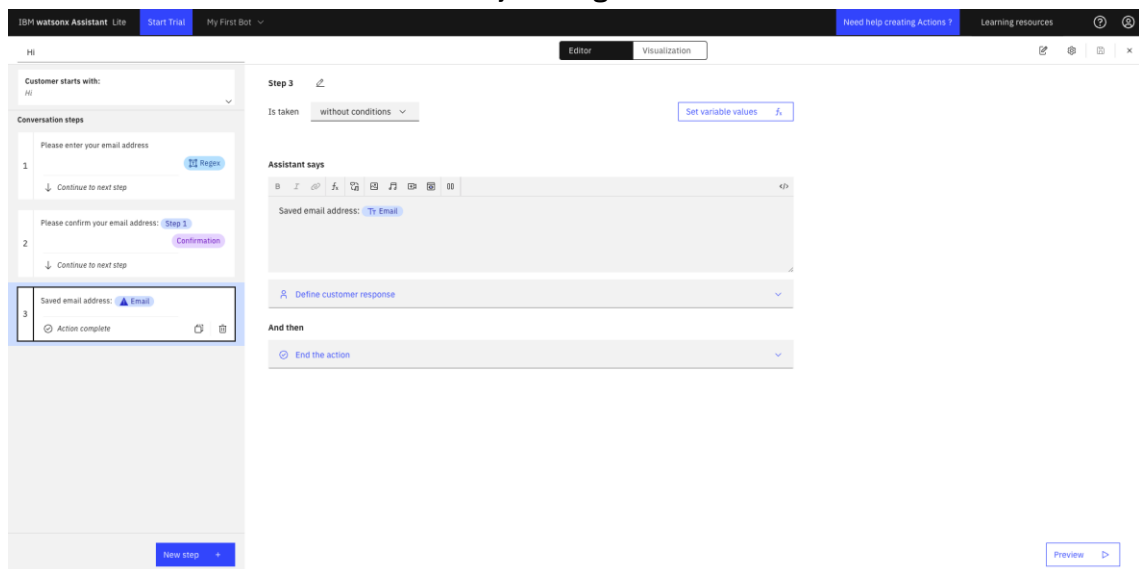

Cancel

Save

- Head back to **the second step** of your action for this task. And click on the **Set variable values** button in the top right corner. Then click on **Set new value → Session variable → Email** and **Action Step Variables → 1. Please enter your email address**.

- Create a new step** via the “**New Step +**” button in the bottom left corner. Enter in the textfield below “Assistant says”: Saved Email address \${Email}. This gives the step access to the session variable “**Email**”. Session variables can be set in one action but can be used by all other actions, remember that it has to be set before it can be accessed. Be sure to end the action by setting **And then** to **End the action**.

- Congratulations!** You have now explored the concept of Action Variables, that are usable in the current action, and Session Variables, that are usable in all actions. Preview your assistant and play around with it.

OPTIONAL

(As you may have noticed, we don't treat the user's responses (yes or no) separately. In this sub-task, we will therefore explore conditions for handling both responses appropriately).

- The third step of the action is the end of the action, which should only be reached if the user agrees with the saved email. For this we set the **Is taken** variable to **with conditions**. Then we set the condition to **2. Please confirm your email address is Yes**:

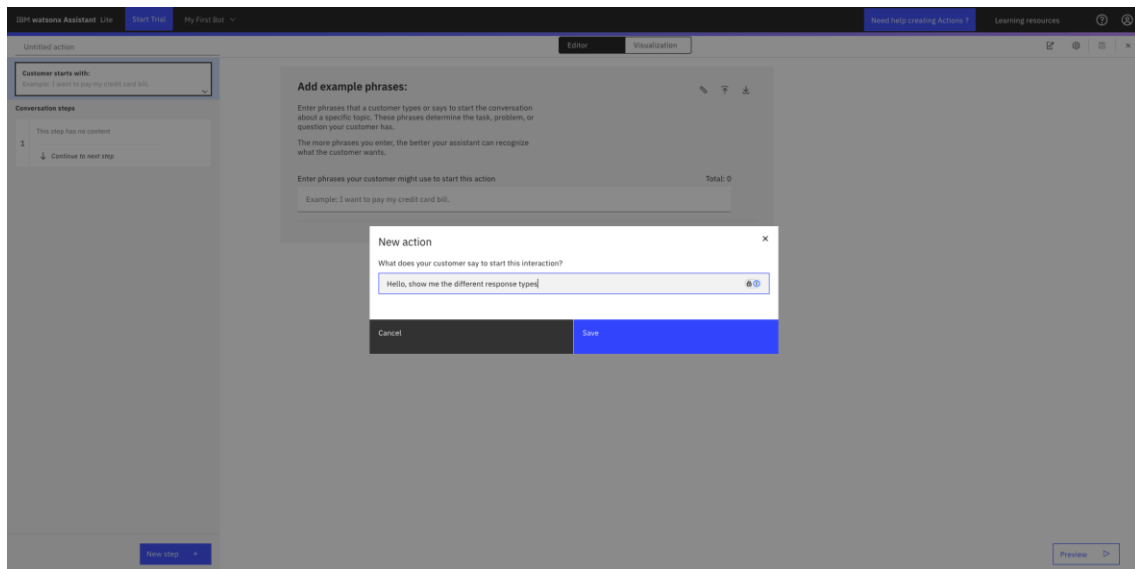

The screenshot shows the IBM Watson Assistant Editor interface. On the left, the 'Conversation steps' list shows three steps: Step 1 (Please enter your email address), Step 2 (Please confirm your email address), and Step 3 (Saved email address: Ty Email). Step 3 is highlighted. On the right, the 'Step 3' configuration panel is open. The 'Is taken' variable is set to 'with conditions'. The condition is '2. Please confirm your email address is Yes'. The 'Assistant says' section shows the saved email address as 'Ty Email'. The 'And then' section shows the action 'End the action'.

- Next is the case where the user answers **No**, in which case we simply loop back and repeat the action from step 1. We add a new step and set the **Is taken** variable to **with conditions**. This time: **2. Please confirm your email address is No**. Then we set the **And then** variable to **Re-ask previous step(s)** and select all steps:

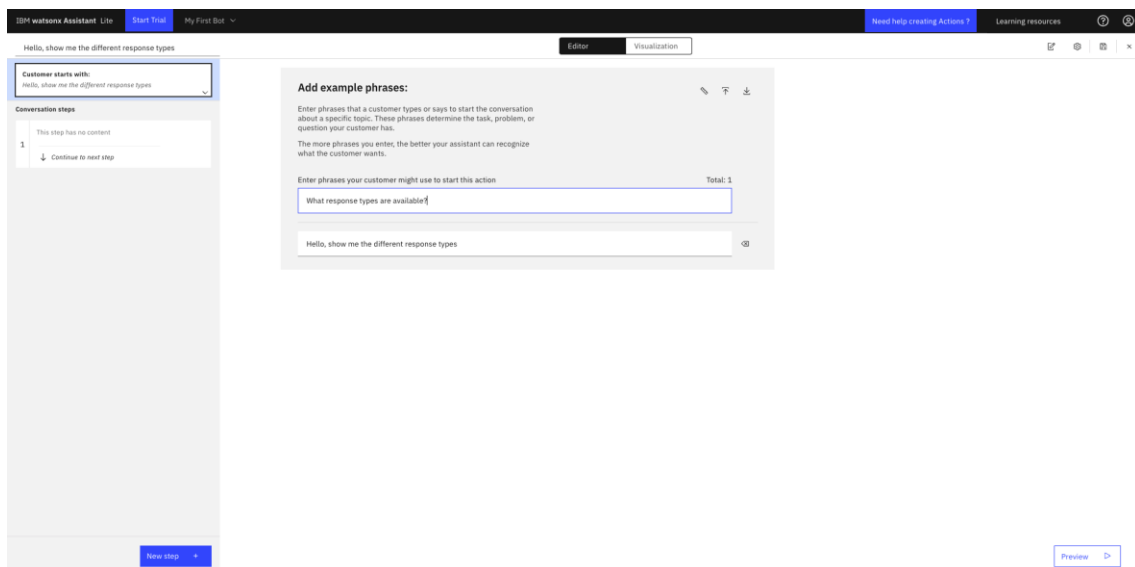

The screenshot shows the IBM Watson Assistant Editor interface. On the left, the 'Conversation steps' list shows four steps: Step 1 (Please enter your email address), Step 2 (Please confirm your email address), Step 3 (Saved email address: Ty Email), and Step 4 (This step has no content). Step 4 is highlighted. On the right, the 'Step 4' configuration panel is open. The 'Is taken' variable is set to 'with conditions'. The condition is '2. Please confirm your email address is No'. The 'Assistant says' section shows the saved email address as 'Ty Email'. The 'And then' section shows the action 'Re-ask previous step(s)'.

Task 5: Response Types

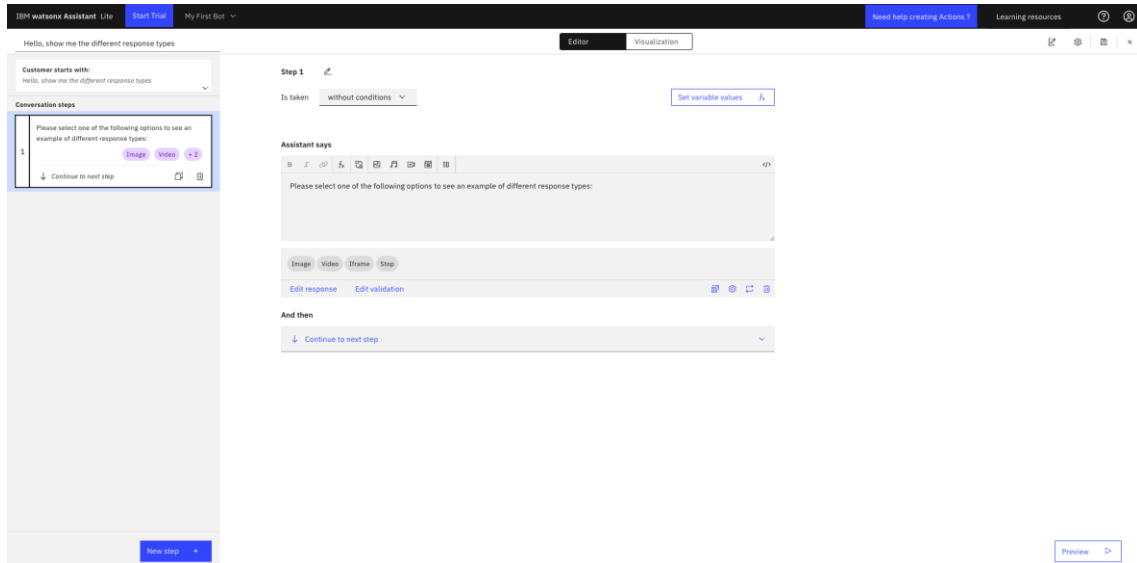

1. Create a new **action** (see Step 1, Task 3).
2. Choose **Start from scratch** (see Step 2, Task 4).
3. **Enter an example** of what your customer says to start this action (i.e *Hello, show me the different response types*)

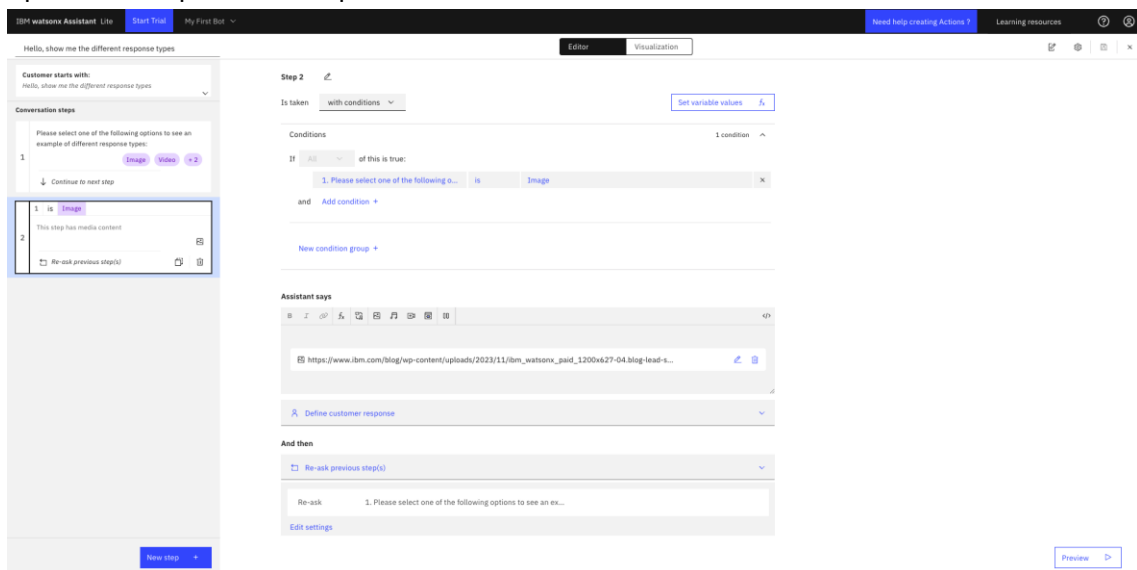

4. **Add more examples** (e.g., *What response types are available?*) by clicking on the element above Conversation steps and typing in the text box. This will help your watsonx assistant to better understand the customer's needs:

- Now that watsonx assistant knows how to start this action, we need to define the steps that define the interaction between watsonx assistant and the customer. Navigate to the **first step**. Write your desired response in the textfield “Assistant says” (e.g., *Please select one of the following options to see an example of different response types:*). Then select **Define a customer response** of type **Options**, enter the following 4 options: **Image**, **Video**, **Iframe**, and **Stop**

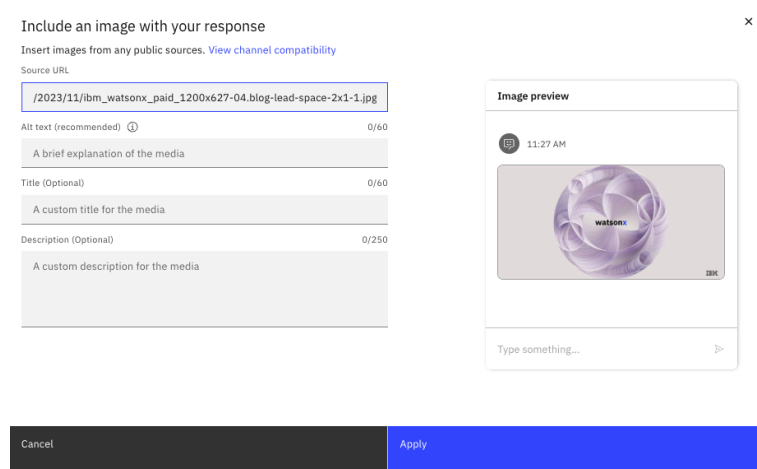

- Add a new step** and define a new condition by setting the **Is taken** variable to **with conditions**. Then set the condition to **1. Please select from the following options is Image**. This ensures that this step is only considered if the user has selected the **Image** option in the previous step.

Then we define the assistant's response. **Click on the Image button** in the menu on top of the textfield below Assistant says.

Search for an Image online to display and enter its URL into the Source URL field. After filling out all the fields click **Apply**:

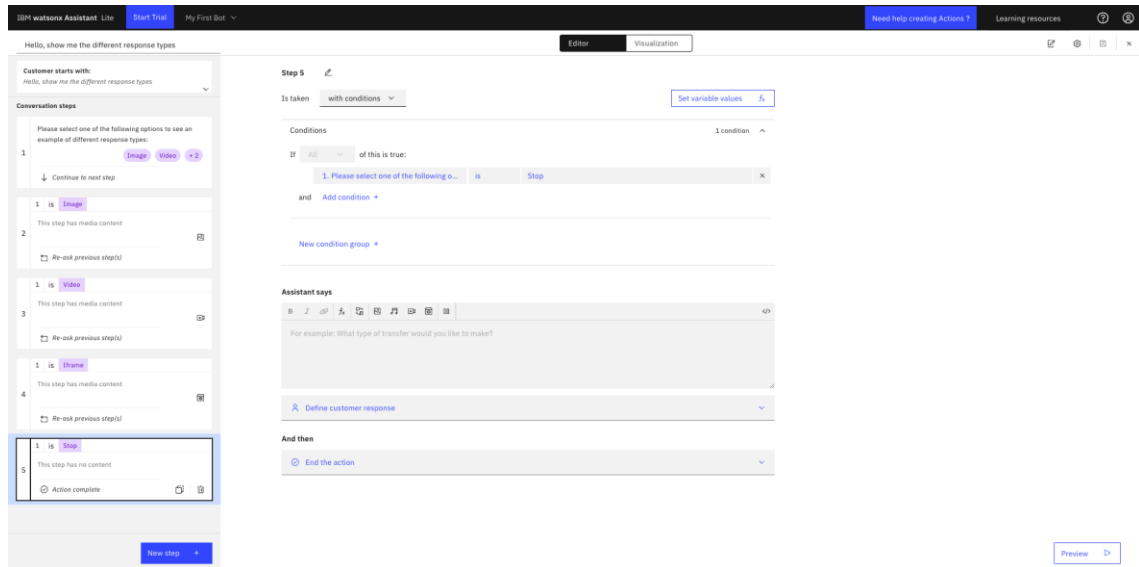

To create a loop, we set the **And then** variable to **Re-ask previous step(s)** and select the first step (see Step 12, Task 4).

7. **Repeat Step 6** (or duplicate Step 2 and adjust it accordingly) for the response types: **Video** and **Iframe**. Remember to adjust the condition.

(Note: use embedded links instead of just the URL from the browser so that your watsonx assistant can scale the frame correctly.)

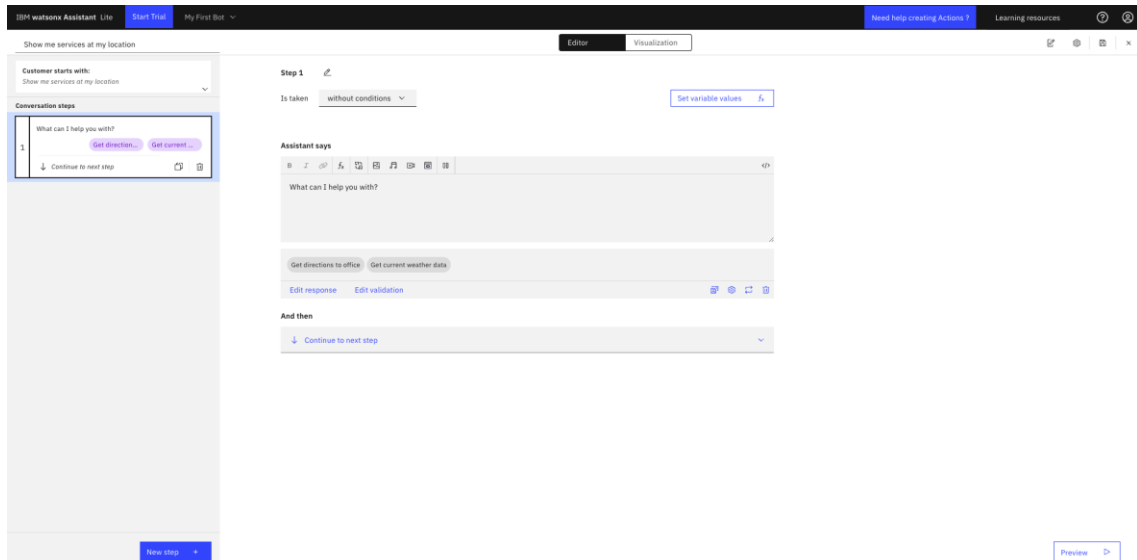

8. We have now created an infinite loop, so what's missing is the break condition. The action should stop as soon as the users chooses the option **Stop** in Step 1. For that, we create a **New step +** and we set the **And then** variable to **End the action**.

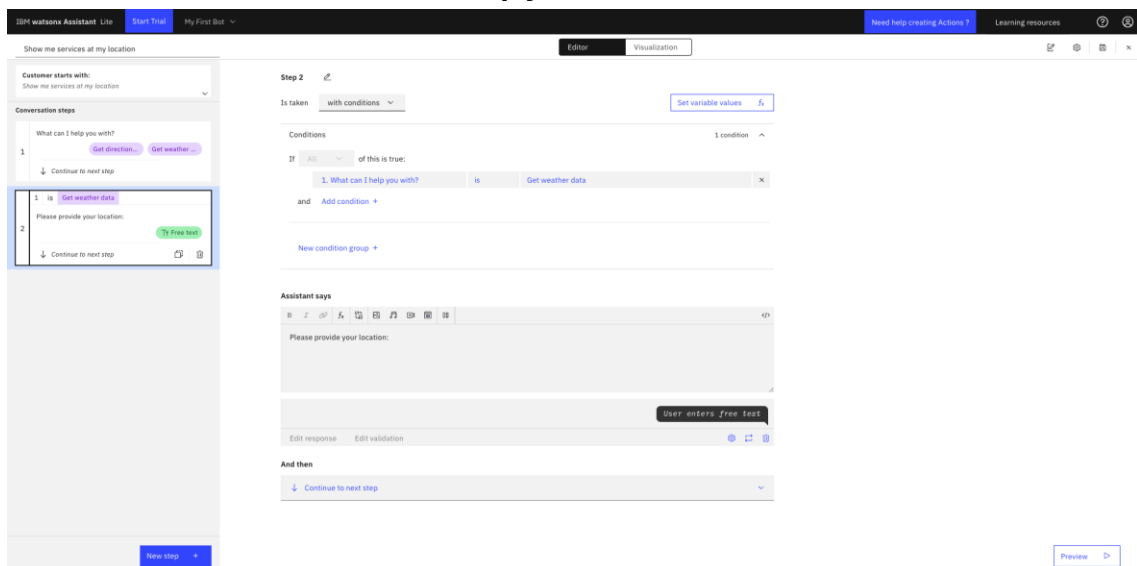

9. **Congratulations!** You have created different response types. Click **Preview** to see your assistant in action.

Task 6: Custom Extension / Dynamic Options

1. Create a new **action** (see Step 1, Task 3).
2. Choose **Start from scratch** (see Step 2, Task 4).
3. **Add an example phrase** (e.g., *Show me services at my location*), see Step 4, Task 5.
4. **Create a new Step** that asks the user *What can I help you with?* and provides two answer options to choose from (*Get directions to office*, *Get current weather data*):

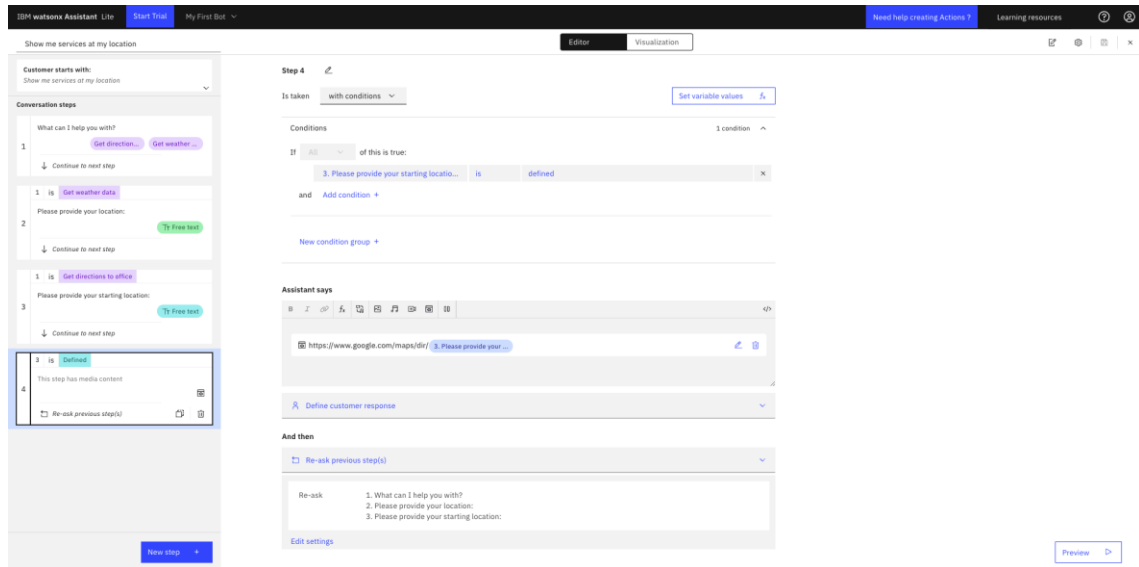

5. **Create a new Step** that asks the user *Please provide your location:* and requires the user to enter some free text. The step should only be triggered if in the previous step the option *Get weather data* has been selected. To do this select **with conditions** and set the condition to **1. What can I help you with is Get weather data:**

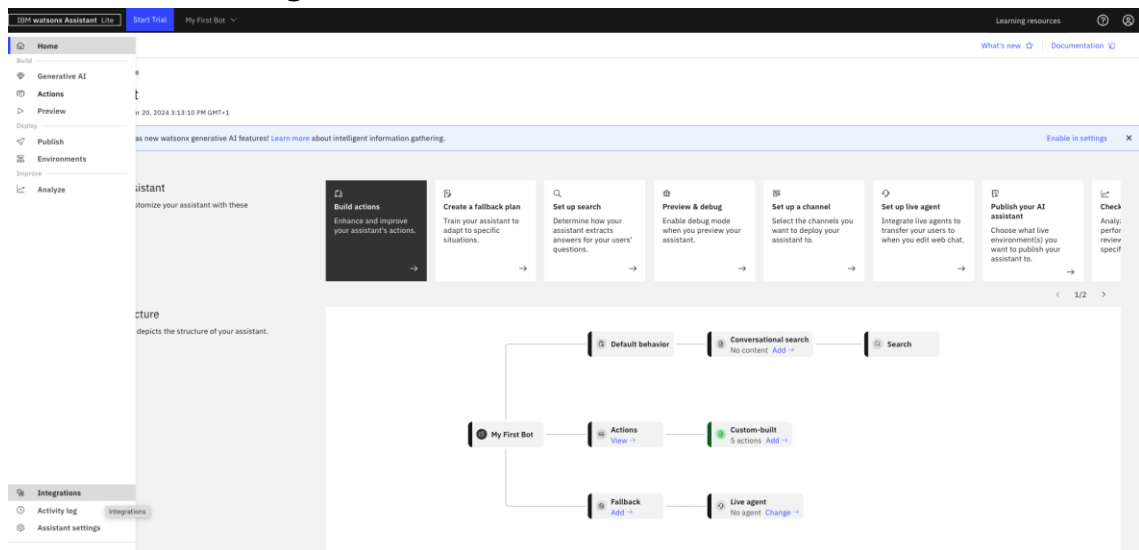

6. Repeat the previous step for the second option **Get way to office** (for that you can also duplicate Step 2 and adjust it accordingly).

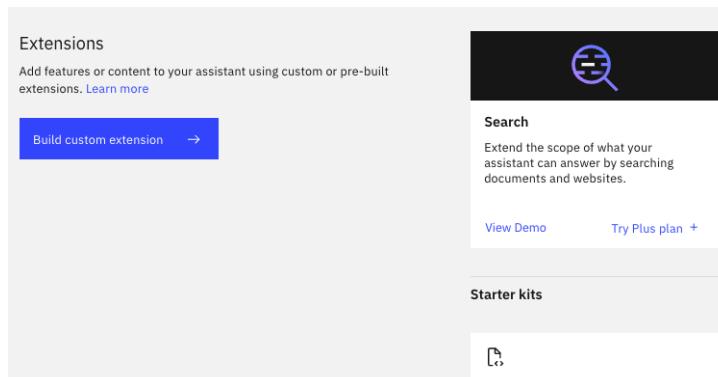

7. Create a **New step +** where you set a condition that checks if a starting location has been provided. As a response define a link to your favorite navigation service where you put in the variable set in Step 5 to be part of the URL:

8. Head over to the Integrations Section

9. Scroll down to **Extensions** and select **Build custom extension**.

10. **Work through** the wizard and import the OpenAPI Spec from the **Appendix** as a .json file. The file is also available in the Box folder where you found this lab.

Custom extension

Close **Next**

☒ Get started ☒ **Basic information** ☐ Import OpenAPI ☐ Review extension

Basic information

Having a clear name and detailed description will help provide context and clarity to what your extension does.

Extension name

My Weather Extension

Extension description

0/128

Example: This extension provides an integration with an external application.

Custom extension

☒ Get started ☒ Basic information ☒ **Import OpenAPI** ☐ Review extension

Import OpenAPI

Import an OpenAPI document in a .json format, describing the authentication and methods for your extension.

Drag and drop file here or click to upload

openapi-spec.json

x

Custom extension

Close **Finish**

☒ Get started ☒ Basic information ☒ Import OpenAPI ☒ **Review extension**

Review extension

Review the servers and extension resources provided in the OpenAPI document.

Review servers

Provided is a list of the servers and server variables found within the OpenAPI document.

URL	Description	Variables
https://weather.visualcrossing.com		

Review operations

This table shows the operations defined in the OpenAPI document.

Operation	Method	Resource
Historical and Forecast Weather API	GET	/VisualCrossingWebServices/rest/services/timeline/{location}
	SERVERS	/VisualCrossingWebServices/rest/services/timeline/{location}

11. **Navigate back** to your Action

12. **Create a new Step** that will call the previously defined custom extension. Define the extension as follows. If the API does not work, create a new Account on <https://www.visualcrossing.com> and create a new API Key under the profile settings

13. **Create a new step** that will reflect the answer gotten by the custom extension as follows:

14. **Congratulations !** You have created a custom extension that speaks to a third party webservice. To see what this means preview your assistant and play around with it.

Task 7: Visualize an Action

1. Open the Action defined in Task 2 or in Task 6
2. In the top center section, click on **Visualization** to visualize your action.
3. **Congratulations!** You have now visualized your flow. Use this option to understand the big picture of the conversation and to discuss with your stakeholders.
